## About the Salesforce.com Certified Force.com Advanced Developer Program

The Salesforce.com Certified Force.com Advanced Developer certification program is for individuals who want to demonstrate their knowledge, skills, and capabilities in building custom applications on the Force.com platform. The program encompasses the breadth of application development on the Force.com platform, including the declarative capabilities, the programmatic capabilities of Force.com code (Apex) and Force.com pages (Visualforce), and application development lifecycle management with cloud computing development as a service.

- The Salesforce.com Certified Force.com Developer certification credential encompasses the declarative capabilities of the Force.com platform. To achieve this credential, a candidate must successfully complete the exam. This exam is a prerequisite to the Salesforce.com Certified Force.com Advanced Developer exam.
- The Salesforce.com Certified Force.com Advanced Developer credential encompasses the programmatic capabilities of the Force.com platform, including Force.com code and Force.com pages. To earn this credential, a candidate must successfully complete three activities:
  1. **The Salesforce.com Certified Force.com Advanced Developer exam:** A multiple-choice/multiple-select proctored exam. This portion of the credential program **must** be passed successfully to move on to the next portion, the programming assignment.
  2. **The Advanced Developer programming assignment:** At scheduled times throughout the year, certification candidates who have passed the Salesforce.com Certified Force.com Advanced Developer exam will be given the opportunity to complete the second portion of the credential program: the programming assignment. A set of requirements and development parameters will be sent to the candidate, and the candidate will have a fixed amount of time to complete and submit the assignment. The candidate will be given the evaluation criteria and detailed instructions on how to complete and submit the final working application. The programming assignment is completed at the candidate's own pace and doesn't require working at a proctored site. However, there will be a deadline for assignment completion.
  3. **The Advanced Developer essay exam:** Upon submission of the programming assignment, the candidate will be required to complete a short-answer proctored exam that covers the specifics of the programming assignment. The candidate will need to go to a testing center and complete the essay exam. The essay exam, in combination with the programming assignment, will be evaluated and scored as the final portion of the Salesforce.com Certified Force.com Advanced Developer certification program.

The Salesforce.com Certified Force.com Advanced Developer credential will be granted to a candidate upon successful completion of all three parts of the program.

## Section 6. Sample Exam Questions

The following questions are representative of those on the Salesforce.com Certified Force.com Advanced Developer exam. These questions are *not* designed to test your readiness to successfully complete the certification exam, but should be used to become familiar with the types of questions on the exam. The actual exam questions may be more or less difficult than this set of questions.

- A customer wants to add a custom validation process to the contact save process. Before a contact is created, the customer wants to include validation, which checks if the associated account is active. This validation should be active for all UI as well as integration requests. Which design accomplishes this goal?

  - A custom Web service
  - A before insert trigger
  - A custom Force.com page (Visualforce) controller
  - A client-side S-control
- How could the use of Lists, Sets, or Maps help avoid governor limit exceptions in the following code? (Choose *two* answers.)

```
for (Account a : trigger.new) {
    for (Contact c : [select id,otherphone from contact where accountid = :a.id]) {
        c.OtherPhone= a.Phone;
        update c;
    }
}
```

  - Reduce the number of SOQL queries executed.
  - Reduce the total number of records retrieved by SOQL queries.
  - Reduce the number of DML statements.
  - Reduce the number of records processed as a result of DML statements.

3. Given the following Force.com page markup and assuming the controller and each extension include an action method named “go,” which class method will be invoked when the user clicks on the commandButton?

```

1 <apex:page controller="theController" extensions="ext1, ext2, ext3">
2   <apex:form>
3     <apex:commandButton value="Go" action="{!go}" reRender="out"/>
4     <apex:outputPanel id="out">{!output}</apex:outputPanel>
5   </apex:form>
6 </apex:page>

```

- A. theController  
 B. ext1  
 C. ext2  
 D. ext3
4. Which statement is *true* about automated testing of custom controllers for Force.com pages?
- A. Unlike other Force.com code tests, Force.com page tests must be executed in the browser.  
 B. Calling Test.startTest() after setting a page fixture invokes a controller action specified in the page’s action attribute.  
 C. Form submission in a Force.com page using a custom controller can be simulated in a Force.com code test class.  
 D. Expected navigation can only be asserted in an Force.com code test when the resulting page is a Force.com page.
5. A Force.com page has a command button that directly calls the doSomething() method shown below, where the MyCustomException is a class that extends the System.Exception class.

```

public void doSomething() {
    throw new MyCustomException('An error message. ');
}

```

Where would the exception be displayed to the user?

- A. In a <apex:messages> component, provided one is included on the page.  
 B. Unhandled exceptions are only recorded in the debug log.  
 C. At the top of the Force.com page.  
 D. On a separate page displaying the exception.
